

Percent Responders by Visit

25

98914-01H

This chart shows the percentage of patients overall who had a good “response” (decrease of 0.5 log or 70% in HIV viral load) at different time points during the study comparing the patients who received placebo to those that received VGV-1.

As you can see, the strongest result appears at day 150 – or 100 days after the completion of treatment. Afterwards, the result is diminished.
